

# Hands-on Mechanical Assessment Tool (MAT) Introduction

Presented By :  
Jacelyn Goh (Clinical Educator/ Product Specialist)  
[jacelyn@lindsrehab.com.au](mailto:jacelyn@lindsrehab.com.au)

# Objectives:

- Identify the systematic approach to MAT evaluations
- Increase confidence to complete hands-on assessments of clients by identifying:
  - Common postural abnormalities
  - Boney landmarks and their positions of symmetry
  - Joint range of motion and corresponding wheelchair seat system angles
- Explore interventions to support a variety of muscle tone presentations in wheelchair seating.
- Discuss simple wheelchair and seating adjustments to improve functional outcomes.
- Learn about complimentary assessment tools available to enhance your understanding of the wheelchair users' postural changes throughout the day.

# Evidence Based Practice

# Why do MAT evaluations?

- To gain a deeper understanding of why the wheelchair user sits the way they do, to understand their full potential to participate in physical tasks, and to complete the client profile of biomechanical assessment and physical examination.
- Only then can we truly develop client-centered goals with meaningful pathways of interventions. It can't be all about the equipment!
- It leads us on a journey of history about current and previous equipment, postural changes, skin integrity, and pressure care management. It is the catalyst that helps us to dig deeper into sitting balance, functioning from the wheelchair, and 24-hour postural management.

# When to do MAT evaluations?

- As therapists, we should be asking “Why am I not doing a full MAT assessment on this client?”
- It may be because your client is:
  - Currently ambulating
  - Able to sit on the side of a plinth or bench with no balance problems
  - Reporting and demonstrating full sensation and the ability to move if uncomfortable and report pain
  - Able to actively complete a set of hip and spine ROM activities
  - Physical assessment can occur through observation and analysis of activities of daily living
- As a “rule of thumb” map everyone's pelvis

# Get to know the base of support

- Pelvis and hips

## Bones of the pelvic girdle

# BASE OF SUPPORT

- Feel/map the following:
  - ASIS
  - Posterior Aspect of the GT
  - ITs
  - Distal aspect of the femur
  - PSIS
  - Sacrum and Coccyx if indicated
- What areas are taking the load?
- Can you improve the distribution of load with the current seat surface?  
Reduce peak mechanical tissue loading and improve area of distribution.
- Do you need to complete a full MAT Ax to understand the asymmetrical postures?

- Spine

# Review all body planes of symmetry

- Consider what it means to be “Symmetrical”?
- What is a “neutral” sitting posture?
- What is a “position of comfort”?
- How do we use this information to increase our understanding and make sound clinical judgments about our client’s seated postures?

Fig. 1.5: Describing postural deviations in three planes

# Talk the Talk before you Walk the Walk

- **Fixed**-fastened securely in position
- **Flexible**- able to be easily modified to respond to altered circumstances
- **Accommodating**- to fit in with someone's needs
- **Correctable**- put right back into neutral
- **Reducible**- capable of being simplified towards neutral
- **Neutral**- belonging to an impartial state or balance
- **Anterior**- nearer the front, especially in the front of the body
- **Posterior**- further back in position; of or nearer the rear or hind end
- **Obliquity**- neither parallel nor at right angles to a specified or implied line; slanting.  
Description of the lower side.
- **Rotation**- the action of rotating about an axis or from center (neutral) – call the direction of rotation
- **Thoracic Kyphosis**- An abnormality of the spine causing excessive curvature of the upper back
- **Lumbar/Cervical Lordosis**- The excessive inward curvature of the spine. It can affect either at the neck or lower back causing pain and discomfort

- **Scoliosis**- a condition characterised by sideways curvature of the spine
- **C-Curve Scoliosis**- single curvature scoliosis, occurs when the spine bends once off its center axis, before bending back around towards the midline of the vertebral column to form a shape roughly similar to the letter C. Defined by the side of the apex
- **S-Curve Scoliosis**- S-shaped curves present with two scoliotic curves, each bending to the opposite side. The two curves of the S-shaped scoliosis are best classified as minor curves and major curves. Define by apex side and locations
- **Convex**- having an outline or surface curved like the exterior of a circle or sphere
- **Concave**- having an outline or surface that curves inwards like the interior of a circle or sphere
- **Apex**-the tip of a pyramidal or rounded structure
- **Thigh-to-trunk angle**- goniometer measurement of the thighs relative to the trunk. Report on redundant tissue impact.
- **ABduct**- Abduction: the movement of a limb or other part away from the midline of the body, or from another part
- **ADduct**- Adduction: the movement of a limb or other part towards the midline of the body or towards another part
- **External Rotation**- rotation away from the center of the body
- **Internal Rotation**- Also known in anatomy as medial rotation, the rotation of a limb in a joint about a vertical axis toward the anterior or front of the body

- **Windswept**- the abduction and external rotation of one hip with the adduction and internal rotation of the other. Defined by the direction the lower limbs face
- **Thigh- lower leg angle**- goniometer measurement of the thighs to the femur. Report on reductant tissue impact
- **Flexion**- the action of bending or the condition of being bent
- **Extension**- the action of moving a limb from a bent to a straight position
- **Hyperflexion**- flexion of a limb or part beyond the normal limit
- **Hyperextension**- the forceful extension of a limb or joint beyond its normal limits
- **Plantarflex**- positioning the foot with the toes furthest down
- **Dorsiflex**- backward bending and contracting of your hand or foot
- **Inversion**- movement of the sole towards the median plane
- **Eversion**- movement of the sole away from the median plane
- **Lateral Flexion**- active or passive bending movement of a body part in the lateral direction

# Commonly Occurring Postures

## SEATED POSITION

© 2012 Confort Company

# Pelvic & Spinal Postures

## CLINICAL ISSUES

## TECHNICAL ISSUES

POSTERIOR PELVIC TILT

Low or absent tone in the trunk muscles  
Limited hip flexion  
Abnormal (high, low or fluctuating) tone in trunk and/or lower extremities  
Pathological reflexes in lower extremities or trunk  
Decreased lordosis  
Tight hamstrings  
Increased thoracic kyphosis  
Decreased pelvic/lumbar spine range of motion

Seat depth too long  
Footplates too high (Thighs not loaded sufficiently)  
Footplates too low (Feet not loaded sufficiently)  
Seat-to-floor height too high for foot propulsion  
Footplate position relative to knee does not accommodate tight hamstrings  
Wheelchair does not provide solid base of support (Sling upholstery)  
Back support too upright  
Armrests too low  
Back does not support posterior pelvis

PELVIC OBLIQUITY

Asymmetrical trunk muscle strength  
Asymmetrical muscle tone (trunk and/or lower extremities)  
Asymmetrical soft tissue or muscle mass  
Asymmetrical pelvis/femur bone structure  
Asymmetrical hip flexion  
Limited hip abduction and/or adduction  
Limited hip internal or external rotation  
Scoliosis

No solid base of support  
Wheelchair too wide  
Armrests too low (Upper extremities not supported)  
Seat shape does not support trochanters  
Seat and/or back does not provide enough lateral pelvic support  
Footplate position and/or seating angles do not support hip range limitations  
Joystick and/or wheel location inappropriate

PELVIC ROTATION

Asymmetrical muscle tone (trunk and/or lower extremities)  
Asymmetrical hip flexion  
Leg length discrepancy  
Posterior dislocated or subluxed hip  
Unilateral foot propeller  
Limited hip abduction and/or adduction range of motion  
Asymmetrical muscle mass in the posterior pelvis  
Scoliosis plus or minus rotation and/or bony deformity

Trunk not supported  
Back support does not support posterior pelvis  
Seat to floor height too high for foot propulsion  
Seat and/or backrest contours too narrow  
Wheel set up incorrect for hand propulsion

Improper positioning in a wheelchair can cause any of the postures described.

ANTERIOR PELVIC TILT

Tight hip flexors  
Tight quadriceps  
Tightened paraspinals  
Weakened abdominals  
Obesity  
Increased lumbar lordosis

Anterior femoral angle (Knees lower than hips)  
Back support too upright  
Excessive lumbar contour  
Trunk not supported

THORACIC KYPHOSIS

With Reduced Lumbar Lordosis (Full C-Curve)

Low or absent muscle tone in the trunk muscles  
Compensation for posterior tilted pelvis  
Spinal fusion or structural spinal deformity  
Diminished head control  
Compensation for visual impairment

Back does not match shape of posterior trunk  
Back does not support posterior pelvis  
Back support too vertical  
Back support too low  
Seat to back angle too open or closed  
Head support mounted too far forward or too low  
Arm supports too low

**Clinical Assessment Goals**  
Identify posture/orthopedic deformities at each body segment.

Is it fixed or flexible?

UPPER THORACIC KYPHOSIS

Diminished disc space in upper thoracic spine  
Hyper extended cervical spine  
Extreme hyper mobility  
Postural deterioration over time  
Diminished head control

Back support too low  
Arm support too low  
Wheel set up incorrect for hand propulsion  
Back does not match shape of posterior trunk  
Head support mounted too far forward or too low  
Seat to back angle too closed

SCOLIOSIS

Asymmetrical muscle tone or strength in the trunk muscles  
Compensation for pelvic obliquity and/or pelvic rotation  
Structural spinal deformity  
Inability to hold the head in midline  
Collapsed lung  
Decreased trunk balance  
Asymmetrical upper extremity strength during manual wheelchair propulsion

Back does not support posterior pelvis  
Back does not match shape of posterior trunk  
Back does not provide enough lateral support  
Seat cushion does not provide pelvic stability  
Wheelchair does not provide solid base of support (Sling upholstery)  
Upper extremity support is too low, too high or too wide  
Not enough head support  
Joystick or wheel location inappropriate

INCREASED LUMBAR LORDOSIS

With Thoracic Extension

Low or absent muscle tone in the trunk muscles  
Compensation for anterior tilted pelvis  
Tightened paraspinals  
Obesity  
Hypermobility of lumbar spine  
Compensation for instability

Anterior femoral angle (Knees lower than hips)  
Back too vertical  
Excessive lumbar contour  
Back support too low  
Posterior pelvic support too high  
Back does not match shape of posterior trunk  
Orientation in space not optimal (system too upright)

# Phase One: Review of Existing Seated Posture

Hands-on, feel and record. Consent for photos. Highlight Landmarks.

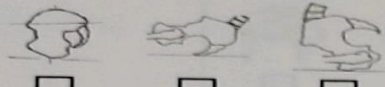

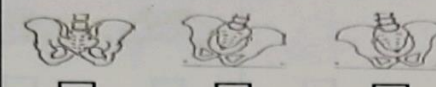

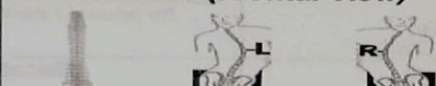

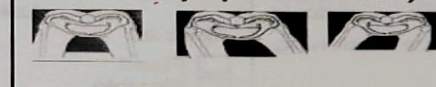

Take the opportunity to dig deeper:

- How long have they had this wheelchair?
- What do they like about it? What don't they like about it?
- Does the person look like this when first transferred into the wheelchair?
- How long is the person sitting in the wheelchair for?
- How long have they been in the wheelchair for at the time of assessment?
- What ADL task do they complete from this wheelchair?
- Are they comfortable?
- Map out existing seating support surfaces.

<https://www.physicaltherapy.com/articles/wheelchair-seating-considerations-for-prop-4785#:~:text=Prop%20sitter%20One%20way%20of%20looking%20at%20wheelchair,sitter%2C%20the%20hands-dependent%20sitter%2C%20and%20the%20prop%20sitter>

# Phase Three: Sitting MAT Assessment

Hands-on, support, and record. Consent for photos. Highlight Landmarks and where postural support is required. Take anthropometric measurements.

Take the opportunity to dig deeper:

- Determine if your client is a “hands-free”, “hands-dependent” or “dependent” sitter
- Do they use functional reach? What happens to posture when functional?
- Are tone responses triggered when gravity is back in play?
- How much do you need to “back off” the posture to ensure comfort?
- Review head and neck control, and assess visual field.

# Outcomes – identify supports required

Anatomical Area	Existing Relation to neutral on all 3 planes	MAT outcomes	Counteracting forces & location	Outcomes to seated support
Upper Limbs	(F) Forearms toward midline (S) Mild Shoulder protraction, Elbow $F \leq 90^\circ$ , no wrist supports (T) Neutral	Prop Sitter Sustained trunk extension through forearm support $\geq$ functional output within midline power zone	- Disperse forearm support across power zone	- Tray surface for positioning elbows at $90^\circ$ with neutral shoulders - Height adjustable wide arm pads water fall when tray not it use with neutral shoulders
Head	(F) Midline (S) Mild Cervical hyperflexion (T) Neutral	Independent head control Cervical stacking toward	- Head support for car transport only	- Maintain PSIS and lumber spine stacking to support cervical spine alignment

Make comment on :  
 Position of Symmetry  
 Position of Comfort/Tolerance  
 Position of Function

# Complimentary Tools

- Pressure Map Imagery
- Loop+ Activity tracker data reports

Functional Task Analysis

# Using the data you have collected

- With deeper understanding comes the ability to set clear seating, mobility, and functional goals. Identify problems you want to fix, and non-negotiable compromises.
- Cover off the key seating principles:
  - Base of support
  - Know the positions of alignment vs comfort vs function
  - Know where supporting forces need to be – match these with equipment features
- Collaborate with your suppliers and share your outcomes. The supplier will help you match the features of the wheelchair and seating systems to support your findings
- Use this data in your outcome measures. Before and after photos and a simplified explanation of the person's physical capacity will help to strengthen your clinical reason

# Take Home Messages:

- Take away confidence from what you have learned today to feel postures and create balance for improved function.
- There is always more to learn! We have just scratched the surface. An in-depth understanding of muscle tone and spasticity and their impact on musculoskeletal position is essential in a holistic physical examination. Specific diagnosis and other considerations also.
- Teamwork makes the dream work! The more hands the merrier! Take a multidisciplinary approach. Know the role of your supplier in the process
- State Spinal Cord Injury Service NSW has developed an online Spinal Seating Education Modules;  
<https://aci.health.nsw.gov.au/networks/spinal-cord-injury/spinal-seating>
